

New from Kastner Design . . . *Renewal* window treatment

If your current view provides less inspiration, serenity, or privacy than you desire, we can help. Our **Renewal** image system places spectacular views of the Islands over your windows. Natural daylight illuminates these transparencies, giving you a rich and marvelous new view.

The range of applications and images for **Renewal** is truly wide. Kastner Design can supply imagery from our existing collection, or photograph subjects specifically to match the specifications of a project. The images of the samples on the opposite side were local scenes collected near the client's facility. These provide the patients with a local frame of reference, helping them feel at ease during the procedure.

Of initial consideration when thinking about covering existing windows with this treatment are three main factors – orientation, ventilation, and dimming and coloration of daylight for the interior space.

The window's compass orientation will determine the amount of sunlight available for illumination of the transparency. It will also determine the relative warmth or coolness of that light. We will use these factors to suggest appropriate subject material, and use them again to guide production to match the light source.

When using the **Renewal** system, any opening windows that are to be covered must then remain closed. Assure that there is sufficient ventilation available in the room once these windows become inoperable.

Like a stained glass window, the **Renewal** treatment will reduce the amount and change the color of the daylight entering the room. This change can add dramatic accents while at the same time shortening the sight lines and creating a feeling of intimacy.

The wide dynamic range of the transparency material gives a jewel-like dimension to the finished product. We use our characteristic Exhibitex glazing on these transparencies. Exhibitex provides a glare-free coating, protecting the piece

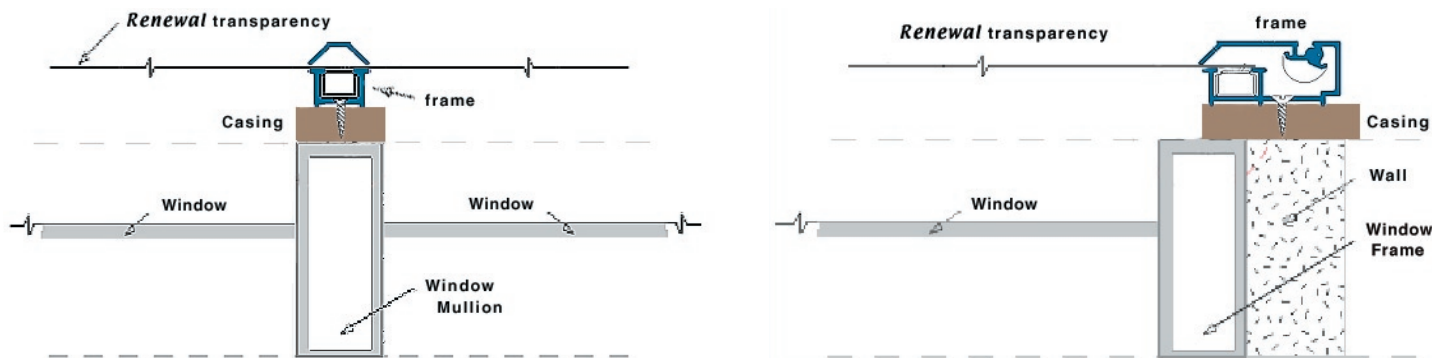

against soiling and fading, while letting the brilliant color shine through.

Every **Renewal** project begins with careful measurements of the window framing. We prefer to place the framing for the artwork on the face of the interior window casing. When covering any but a single framed window, we choose to divide the image to match the plan of the existing fenestration. The two example images shown on the opposite side were divided into diptych format because of a large dividing muntin in the existing windows. By dividing the image into pieces, long, multiple light designs are possible, as are windows with horizontal dividers.

Due to the custom nature of this product, we can only publish a rough per square foot cost in this literature. We are happy to provide you with a complimentary walk-through of your facility and a **Renewal** quotation. For new construction, or more remote clients, we can easily work up a quotation from plans (scaled elevation and section).

Outstanding print quality is an important end product at Kastner Design, and decisions we make from the very start effect the final quality of our work. We have chosen to use cameras with a large film area to minimize the overall enlargement and to render a finer grained print. We have invested in the highest quality lenses for both our cameras and our darkroom to once again deliver maximum sharpness and color accuracy.

Our commitment to quality is also reflected in the design and service portions of our business. It is our continuing goal – through our combination of business-like attitude as well as our artistry – to more than fulfill your expectations.

sample Renewal transparency prices

Print Size	Renewal transparency	Price / sf.
24" x 36"	599.00	FOB gallery
36" x 48"	1073.00	installed \$89 / sf.
